[IntroLab]
Introduction to a Asteroids Game

Introduction: Asteroids is a multi-directional shooter arcade video game released in November 1979 by Atari Inc. and designed by Lyle Rains and Ed Logg.

The player controls a spaceship in an asteroid field which is periodically traversed by enemy spaceships. The objective of the game is to shoot and destroy asteroids and enemy spaceships without colliding with asteroids or being hit by the counter-fire of enemy spaceships. The game becomes harder as the number of asteroids increases, and move faster.

Objectives: The purpose of the first project is to become familiar with the JavaFX library to make a 2D Asteroids game.

Class Work: To get started with the lab follow the following steps:

- Download and install [JDK].
- Install IDE ([Netbeans IDE] or IntelliJ)
- Fork the provided [AsteroidsFX] repository from GitHub.
  This project provides the solution examples and should only be used for inspiration when you implement your own Asteroids game.
- Open the *"AsteroidsFX"* project in the IDE.
- Build the project from the root folder with the Maven command : "`mvn clean install`."
- Run the project from the root folder with the Maven command : "`mvn exec:exec --non-recursive`"
- Create **Your Own** JPMS project setup following this guide [Maven JPMS Guide].
- Implement the, Core, Bullet and Player component in your own project.
- Implement an enemy spaceship in the project. The enemy spaceship should shot and move randomly.

What is next?: In future projects, you have to implement the Asteroids game and add new extensions using JAVA Platform Module System (JPMS).
